

The need to rationalize the manual tickets processing (forms with consideration delay + receipts) and their storage in backoffice are present nowadays in many administrations. During the research, a long period of time is spent for the assignment of each case. EPSISCAN brings the solution. All documents are referenced thanks to the scanning tickets and the incoming correspondence designated to the violation case and are assembled in an electronic folder from which they can be directly visualized. This solution is an innovating investment bringing a better administrative effectiveness and a permanent access to all documents related to a case.

A more rational work and a better availability of information by a simple management of the documents by case.

A simplified research, because all the documents are in the electronic file.

Tickets are scanned "in pile" and post marked with a continue schedule numbers (the number is recorded as a reference in the file of the violation case, in order to facilitate the research of the original case if needed). Scanned tickets are directly displayed for processing. Only required data will be registered for ulterior pre-processing. The citation number in OCR B is automatically interpreted. At the time of ulterior processing, for instance if the fine is not paid on time (respecting delay), the tickets (electronic format) are automatically displayed on the screen in order to complete the file with the information needed.

Rationalization of the treatments.

New technologies as handwritten interpretation (ICR, DigitalPen) are new challenges for us in which we are completely involved.

The incoming correspondence (mails arriving from drivers or any other administrations) are also scanned and if possible automatically assigned to the corresponding case of violation. When the assignment of the case is not done automatically, it becomes necessary to register it on the screen using a manual process.
